    Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                        699

No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
                                                                                                                                                                                              Score
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             protein search, using

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a method of inducing, in a susceptible host, the production of antibodies against a CS6 protein, comprising administering a composition of matter comprising bacteria transformed with a plasmid containing genes cssA, cssB, cssC and cssD, an origin of replication, a Lac promoter and a kanamycin resistance gene, where the bacteria expresses both CS6A and CS6B proteins. The invention also relates to a composition of matter comprising a protein in a pharmaceutical carrier. The pharmaceutical carrier is a carbonated liquid. The method is useful for inducing the production of antibodies against the CS6 protein. The protein and composition are used as vaccines for preventing pathological effects of enterotoxigenic E. coli. This sequence represents the Escherichia coli E8775 antigen cssA of the invention.

                                                                                                                                                                                                                                                                                                       The invention relates to a method of inducing in a susceptible host, the production of antibodies against CS6 protein comprising giving a composition of matter made of bacteria transformed with a plasmid, which contain genes cssA and cssB, all of cssC and DNA sequence cssD that encodes at least 802 amino acids (at least 2406 base pairs), an origin of replication, a Lac promoter, and a kanamycin resistance gene, where the bacteria overexpress both CS6A and CS6B proteins. The method and proteins are useful for stimulating protective antibodies against enterotoxigenic Bscherichia coli. This sequence corresponds to the E. coli CS6 ccsA
                                                                                                                                                                                                                                                                                                                                                                                                                                             Inducing in a susceptible host, the production of antibodies against CS6 protein, useful for stimulating protective antibodies against Escherichia coli by administering a composition comprising bacteria transformed with a plasmid.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    문
                                                   The invention relates to a method of inducing, in a susceptible host, the production of antibodies against a CS6 protein, comprising administering a composition of matter comprising bacteria transformed with a plasmid containing genes cssA, cssB, cssC and cssD; an origin of replication, a Lac promoter and a kanamycin resistance gene, where the bacteria expresses both CS6A and CS6B proteins. The invention also relates to a composition of matter comprising a protein in a pharmaceutical carrier is a carbonated liquid. The method is useful for inducing the production of antibodies against the CS6 protein. The protein and composition are used as vaccines for preventing pathological effects of enterotoxigenic E. coil. This sequence represents a CS6 related protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Inducing the production of antibodies against CS6 protein, useful preventing pathological effects of enterotoxigenic E. coli, by administering a composition comprising transformed bacteria produc

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a method of inducing in a susceptible host, the production of antibodies against CS6 protein comprising giving a composition of matter made of bacteria transformed with a plasmid, which contain genes cssA and cssB, all of cssC and DNA sequence cssD that encodes at least 802 amino acids (at least 2406, base pairs), an origin of replication, a Lac promoter, and a kanamycin resistance gene, where the bacteria overexpress both CS6A and CS6B proteins. The method and proteins are useful for stimulating protective antibodies against enterotoxigenic. Escherichia coli. This sequence corresponds to the E. coli CS6 ccsA

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a method of inducing, in a susceptible host, the production of antibodies against a CS6 protein, comprising administering a composition of matter comprising bacteria transformed with a plasmid containing genes cssA, cssB, cssC and cssD, an origin of replication, a Lac promoter and a kanamycin resistance gene, where the bacteria expresses both CSGA and CSGB proteins. The invention also relates to a composition of matter comprising a protein in a pharmaceutical carrier. The pharmaceutical carrier is a carbonated liquid. The method is useful for inducing the production of antibodies against the CSG protein. The protein and composition are used as vaccines for preventing pathological effects of enterotoxigenic E. coli. This sequence represents the Escherichia coli E8775 antigen cssB of the invention.

The invention also relates to a composition of matter comprising a protein in a pharmaceutical carrier. The pharmaceutical carrier is a carbonated liquid. The method is useful for inducing the production of antibodies against the CSG protein. The protein and composition are used as vaccines for preventing pathological effects of enterotoxigenic E. coli. This sequence represents a CSG

                                                                                                                                                                                                                          CC and phosphatase (KPP). KPP agonists and antagonists are useful for CC diagnosing, treating or preventing disorders associated with aberrant CC expression of KPP, particularly cell proliferative disorders (e.g. arteriosclerosts, atherosclerosts, clirhosts, hepatitts, paroxysmal nocturnal haemoglobhnuria, polycythaemia vera, psoriasis, primary CC thromobocytopaenia or cancer), developmental disorders (e.g. renal tubular cardosis, antenia, polycythaemia vera, psoriasis, primary CC thromobocytopaenia or mental retardation), neurological disorders (e.g. Alheimer's disease, Parkinson's disease or epilepsy), autoimmune/ CC inflammatory disorders (e.g. AIDS; acquired immune deficiency syndrome, CC disease, diabetes mellitus, glomerulonephritis, contact dermatitis, Crohn's CC disease, diabetes mellitus, glomerulonephritis, fortiable bowel syndrome, CC gout, Grave's disease, Hashimoto's thyroiditis, irritable bowel syndrome, CC multiple sclerosis, osteoarthritis, osteoporosis, panoreatitis, Reiter's syndrome, rheumatoid arthritis, Sjogren's syndrome, uveitis), or viral, bacterial, fungal, parasitic, protozoan or helminthic infections. The KPP Ci suseful in assessing the effects of exogenous compounds on the cosperior of nucleic acids and kinases and phosphatases. KPP gene is clieses The meneral as human KPD profesi
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       07-DEC-2001;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 밁
The present sequence is that of the C-terminal domain of a Ser/Thr protein kinase of Thermobifida fusca. Sequence homology is shown to the C-terminal domain of Ser/Thr protein kinase PknB ADW47924 of Mycobacterium tuberculosis. M. tuberculosis PknB, PknA and protein phosphatase PstP ADW47922, along with other signaling modulators, co-ordinately regulate cell alongation during growth. The invention provides claimed methods for identifying substances that modulate the activity of M. tuberculosis PknB
                                                                                                                                     Identifying substances that modulates pknB protein kinase or pstp2 phosphatase activity, for identifying antibacterial substances, by comparing the activity from cells contacted with the substance to

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a novel purified protein having Elk1 phosphorylation activity and/or an activity of activating Elk1 phosphorylation kinase. A protein of the invention has antiinflammatory, immunomodulator, virucide, cytostatic, antiallergic, anti-HIV activity. The polynucleotides may have a use in gene therapy. The gene and its encoded protein are applicable in diseases, viral diseases and cancer such as rheumatoid arthritis, diabetes, asthma, allergic rhinitis, AIDS, viral hepatitis and IgA nephritis. The present sequence is used in the

CC Enterococcus fascium encoding an Enterococcus fascium polypeptide having CC enterococcus fascium encoding an Enterococcus fascium polypeptide having CC one of 10 fully defined sequences given in the (or comprising 40 CC sequential nucleotides chosen from any of the nucleic acids, its CC complement or sequences hybridising to it). Also included are a CC recombinant vector comprising the nucleic acid operably linked to CC transcription regulatory element, a cell comprising the vector and a CC chosen from 3654 disclosed sequences encoding 3654 disclosed proteins. CC The nucleic acids is useful for diagnosing pathological conditions cresulting from E. fascium bacterial infection (e.g. urinary tract infection, bacteraemit, endocarditis, wounds and abdominal-pelvic infection) and for screening drugs such as agonists and anterocurrent.

```
Ct the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid canceling a polypeptide whose expression is inhibited by the antisense comprised whose expression is inhibited by the antisense comprised containing the vector; (3) an isolated containing the polypeptide; (6) inhibited by the antisense contained for containing the vector; (6) inhibited by the containing the polypeptide; (6) inhibited by the containing the polypeptide; (6) inhibiting cellular containing the polypeptide; (6) inhibiting cellular containing the polypeptide; (6) inhibiting cellular containing the gene product or that antibioty against a biological pathway contained for proliferation, or that inhibits cellular proliferation; (6) identifying a gene required for cellular proliferation or the biological pathway in which a proliferation required gene or its gene product lies or a gene on which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound that inhibits proliferation of an organism containing strains in which the gene compound that inhibits proliferation of containing the strains is present in a culture or collection of containing or (13) identifying the target of a compound that inhibits the containing the extent of a compound that inhibits the containing the extent of containing the containing the containing the containing the containing the containing the containing the containing the containing the containing the containing the containing the containing the containing the containing the containing the containing the containing the containing the containing the containing the containing the containing the containing the containing the containing the cont
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        06-SEP-2001;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Percent Similarity:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Alignment Scores:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to Aspergillus fumigatus genes that are essential and are potential targets for drug screening. The methods and compositions of the present invention are useful for diagnosing and/or treating invasive Aspergillus fumigatus infection, including the allergic forms of the disease, such as Farmer's lung disease. They can also be used in various drug discovery purposes, such as expression of the recombinant protein, hybridization assay and construction of nucleic acid arrays. The present sequence represents an Aspergillus fumigatus essential gene protein sequence, used during dispossis and drug development in the invention. These genes share a high degree of sequence conservation with known essential genes of candida ablicans. The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format from WIPO.
